# Images are everywhere

# Benefits of light-fields

## 2D images miss interactivity

- 2D images are flat

# Benefits of light-fields

## Motion parallax as depth cue

- Allows for different perspectives
- Motion parallax is a strong depth cue
- Allows to walk in a 3D scene

- Manipulation (i.e. relighting)

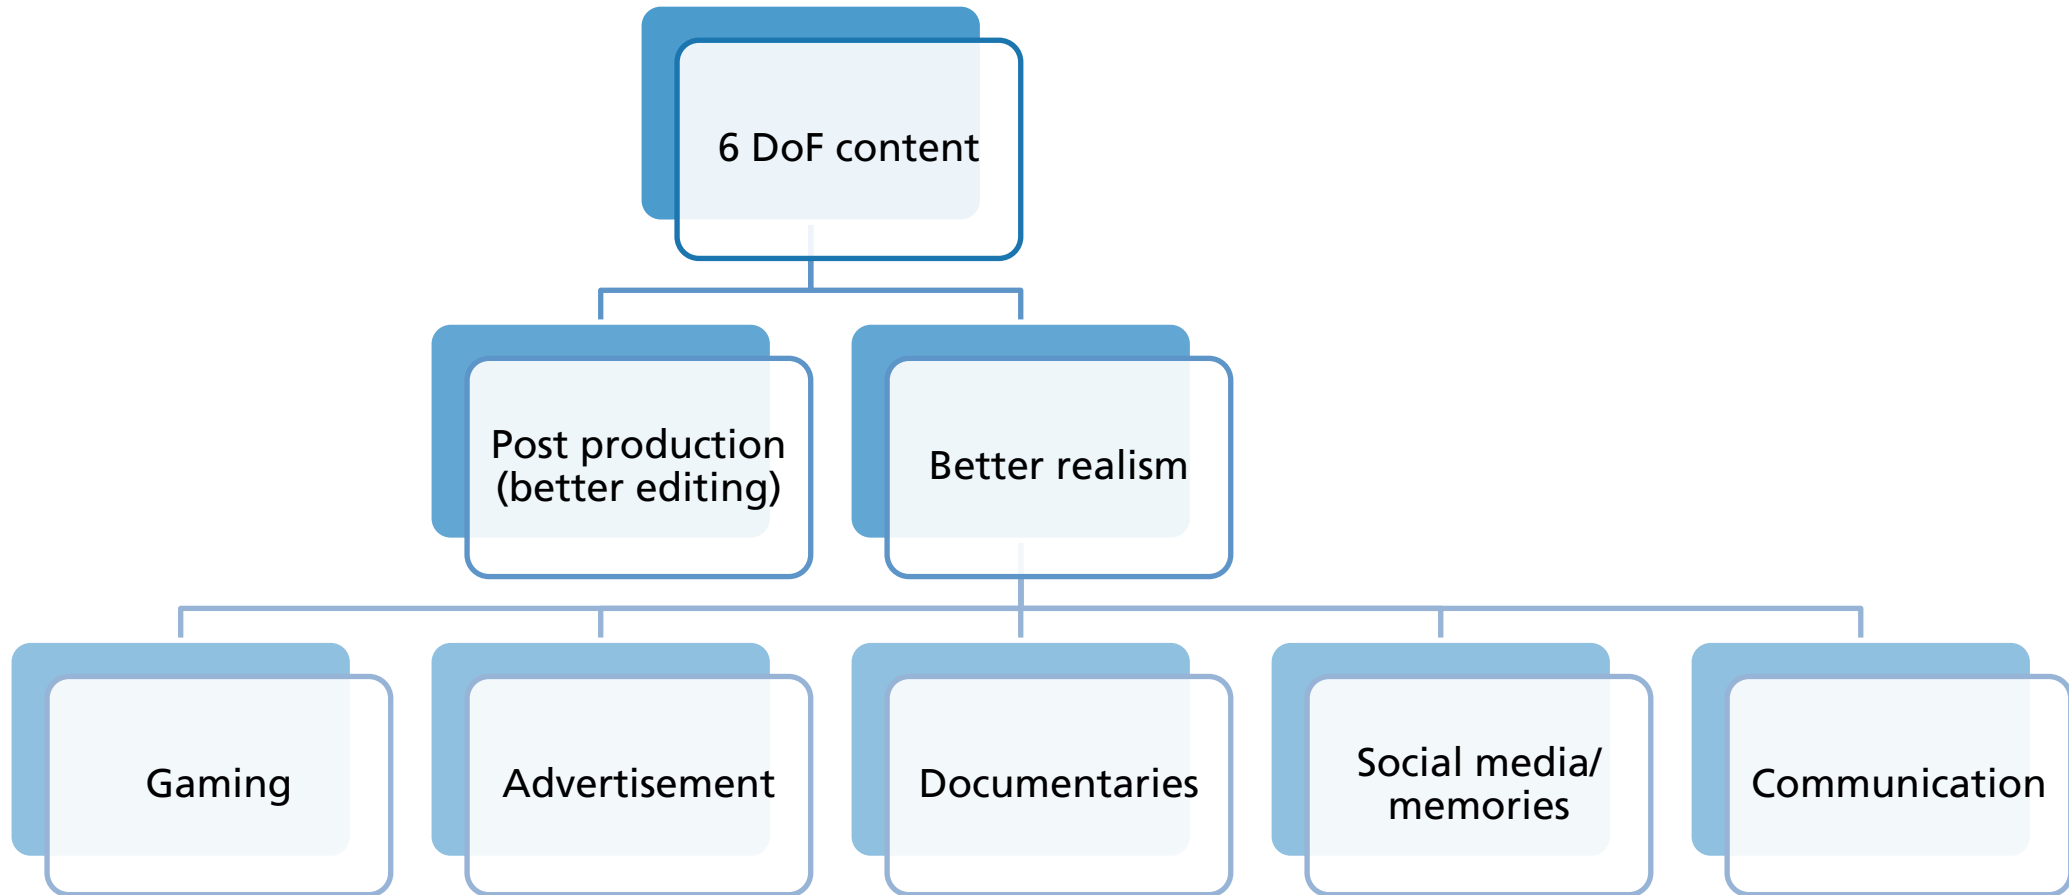

# Challenge

## Content production still difficult

# Applications

# Applications

## Photorealistic objects in gaming

- Computer games in known cities
  - Combines leisure with stimulation of tourism
- Have realistic objects in computer games
- Melting movie and gaming genres

- Explore object, environment
- Choose speed
- Focus on points of interest
- Better spatial feeling

# The vision

## True spatial experience for everyone

- Capture and watch objects from multiple perspectives
- Allow exploration by movement
  - That's what we do in reality
- Document real happenings
  - Record instead of modelling
- High realism
  - Reflections, refractions, ...

# Introduction of light-fields

## Definition

- Captures all rays traversing a surface (use of multiple cameras )
- Perfect capture of all perspectives for an object

# Related technologies for light-field acquisition

## Unique selling points of light-fields

- Large number of perspectives
  - Better handling of occlusions
  - Better reproduction of view dependent effects
  - Better disparity maps
- Faithful reproduction of reality (photorealism)
- Maintenance of captured quality
- No geometric simplifications (no direct need of a 3D mesh)

# Summary

- Light-fields allow photorealistic capture and reproduction of scenes for 6DoF applications
- Main benefits are high sampling quality and photorealism
- Various tradeoffs between capture efforts, scene complexity and rendering quality
  
- Integration into today's workflow still a research task that needs joint efforts
